The Japan claims 113 ...

((-----)))

Council News

Whether you like it or not, Japanese scientists claimed to have element 113 synthesized (see Chemistry News). Any implication from such about our education reform (NSS/DSE/NAS/334) in the new Era ?

Japanese scientists and a Russian team had claimed that they had synthesize the new element 113 in May-2012. And, the Japanese recently asked the panel to take their latest paper into consideration along with their earlier results. At the moment of writing, the IUPAP and IUPAC, who had certain criteria for discovery of a new element (**), still not confirm the case.

Back to HK, "Hong Kong" or "HKSAR"? NSS, DSE or NAS or 334? Is this education reform just a matter of individual subject development and amendment? No matter how you call and view it, the NSS/DSE (just like the Hong Kong society) is being impacted by many social unrest -- from educational to civic to national issues. Such impact will surely affect both teachers and students, and to the outer circle -- the employers, parents, etc. Though the discussion of politics is not common in our classrooms, especially in the already-time-limited NSS-science-lessons, this may not be the case in the students' mind when they are bombarded by various forces outside the classroom. No one could deny that the arrangements throughout the years were not effective, not efficient and that leads to emotional comments (especially under the pressurized social movements).

Meanwhile, the EDB and HKEAA are trying hard to lead and guide the review of the NSS/334 system with the completion of the first cycle of the DSE. However, professionals have voiced that there is no published statement about the review and educators can't see that the EDB has any "principles" and "theories" behind the implementation and review. For front-line teachers, most are concerned about the details of their own subject problems -- viz, topics to be deleted (DUE to actual time constraints, especially for the

So, do we NEED a new start in the 334/NSS/DSE -- with a thorough view rather than bit-by-bit survey from schools / teachers? How about the views of students, parents, employers, ... -- the other stakeholders of the society that the education sector serves? The World and the Society has changed! We need a new way of establishing our systems. Teachers -- would you check and think out-of-the-box in the traditional way for the sake of our future society? Could the EDB and HKEAA lead us to the ocean with suitable "safety rules" or just providing free-size "life-jackets"?

You may also send your comments, reviews, ... to the Office via any channel (email, phone, fax, ...). We hope that teachers could professionally adjust their teaching and learning context before the Authorities have any confirmed suggestions. See you in the coming SBA Conferences and activities.

New compounds from 4900-year-old wood -- insights to pre-historic Environmental Science?

The French scientists have identified unique molecules from an ancient piece of oak that could help to solve the time-machine problem. Pierre Adam & co-workers, University of Strasbourg, used gas chromatography-mass spectrometry (GCMS) to identify triterpenoid molecules which are unusual in their structures compared to the present naturally occurring ones. The difference could be due to chemical breakdown of the molecules by micro-organisms in the environment where the wood is buried.

Element No. 113 -- made by Japanese Scientists ... /.. Oct-2012

Japanese scientists have announced synthesis of element 113, which has the unglamorous placeholder name ununtrium. Several heavier elements have been synthesized (man-made), but 113 has been elusive. Researchers at **RIKEN Nishina Center** for Accelerator-Based Science in Japan said they made the element back on August 12, 2012, but were unable to capture proof of the highly unstable element before it decayed. Now they say they have the decay scheme that proves the creation of the new element.

How 113 Was Made → **Kosuke Morita** and his team collided **zinc nuclei (30 protons)** with a thin layer of **bismuth (83 protons)** to form **nuclei with 113 protons**. The nuclei underwent alpha decay, turning element 113 into element 111, 109, 107, 105, 103 and element 101, Mendelevium.

Once verified, this will be the first time Japan has made claim to a new element discovery. What do you think the researchers will name 113?

Rare Earth Recycling ... ↔ STSE !

Belgian speciality chemicals giant Solvay has officially opened two new sites in France for recycling rare earth elements.

Demand for such elements is extremely high because of a complex mix of political, economic and technological pressures. In recent years, instability resulting from international disputes involving China, which supplies 96% of rare earth elements to the global market, has prompted companies to look more closely at their supply chains.

The sites will recover a range of elements – lanthanum, cerium, terbium, yttrium, europium and gadolinium – from low-energy light bulbs, batteries and magnets in a bid to diversify the supply chain.
